To: All Fire and EMS Agencies

From: Gary Robison, Fire Safety & Risk Management  
Mark Nelson, EMS Data Registry

Subject: New Software Program Training Announcement

The Indiana Department of Homeland Security Fire and EMS will be offering a new web-based software data system called the FH.NET.

This new FH.NET system allows you to enter your Incident Runs through a state-owned web server, and the new FH.NET program will have the same three modules as the previous state issued software CD program -- Fire, EMS, and Staff.

You will no longer have to worry about maintaining a software program with updates and backup procedures; the IN DHS Fire and EMS personnel will do those projects for you.

One requirement for your department or person entering the data would be through an internet connection; a dialup service will work.

The second requirement for your department would be to attend a special class on the usage of the system. Only one class is required. The class locations and times are attached. Due to limited seating space at some locations, we must ask that a maximum of three people from each agency may attend.

This program is offered free of charge to all Fire/Ems service agencies.
